

Fitted DM-CART trees, 2024 cohort

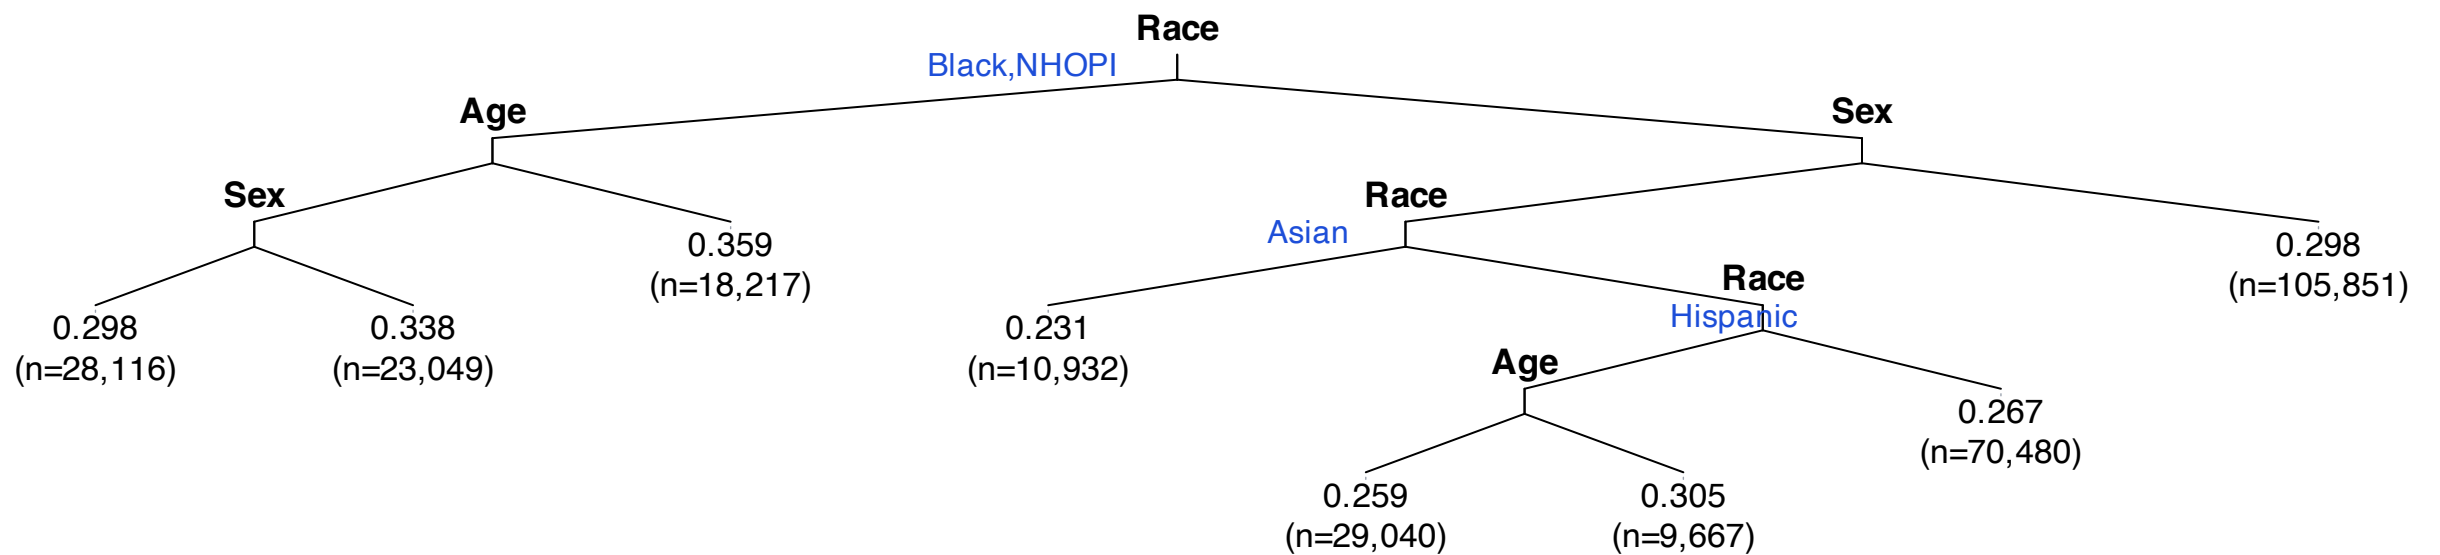

Full model (K = 11)

23 terminal nodes | leaves give posterior P(LBW) and the number of births

LBW-only model (K = 10)

8 terminal nodes | leaves give posterior P(Q1, Q_2, or Q3 | LBW) and the number of births

Binary splits are unlabelled: the left branch is always the reference level of Table 1.

Node labels give the split variable. Blue labels give the levels sent LEFT at a multi-level split; the right child is the complement.
